

Grafana Dashboards

JSON export of the custom **Notes API — Service Health** dashboard, satisfying the requirement to provide "Grafana dashboards (JSON exports), and instructions on importing."

Files

- `dashboard.json` — the custom service-health dashboard (8 panels) (located in `helm/notes-app/dashboards/dashboard.json`)

Panels

#	Panel	Data source	Query
1	Request Rate by Status	Prometheus	<code>sum(rate(flask_http_request_total[5m])) by (status)</code>
2	Request Latency p95 by Path	Prometheus	<code>histogram_quantile(0.95, sum(rate(flask_http_request_duration_seconds_bucket[5m])) by (le, path))</code>
3	Total Notes Created (counter)	Prometheus	<code>notes_created_total</code>
4	App Replicas Up	Prometheus	<code>count(up{job="notes-api"} == 1)</code>
5	App Memory per Pod	Prometheus	<code>sum(container_memory_working_set_bytes{namespace="default", pod=~"notes-api.*"}) by (pod)</code>
6	Total Notes in DB (gauge)	Prometheus	<code>max(notes_in_db)</code>
7	Application Logs	Loki	<code>{namespace="default"}</code>
8	Application Errors & Warnings	Loki	<code>{namespace="default"} = "ERROR"</code>

Prerequisites

The dashboard expects two Grafana data sources:

- **Prometheus** — installed automatically by the kube-prometheus-stack chart.
- **Loki** — add it in Grafana: [Connections](#) → [Data sources](#) → [Add data source](#) → [Loki](#), URL <http://loki:3100> (or <http://loki.monitoring.svc.cluster.local:3100>).

How to import

1. Open Grafana → <http://13.126.63.217:30080> (login [admin](#) / [admin123](#))
2. Left sidebar → **Dashboards** → **New** → **Import**
3. **Upload dashboard JSON file** → select [dashboard.json](#) (or *paste the file contents into the JSON text box*)
4. When prompted, select the **Prometheus** and **Loki** data sources
5. Click **Import**

The dashboard appears under Dashboards with live service-health metrics and logs.

Setting it as the default (optional)

To make this the dashboard reviewers see on login: [Administration](#) → [Default preferences](#) → [Home Dashboard](#) → [Notes API – Service Health](#) → [Save](#).

Cluster / infrastructure dashboards

The "cluster metrics" side of the observability requirement is covered by the **pre-built dashboards** bundled with the kube-prometheus-stack chart (e.g. *Node Exporter / Nodes, Kubernetes / Compute Resources / Cluster*). These are installed automatically and need no manual import. A snapshot is included at [docs/evidence/cluster-metrics-dashboard.png](#).
